HandsMen Threads: Elevating the Art of Sophistication in Men's Fashion

What is Salesforce

Salesforce is a cloud-based Customer Relationship Management (CRM) platform that helps businesses manage interactions with their customers, track sales, and run marketing campaigns in one central place. Instead of installing software on local computers or servers, users log into Salesforce through a web browser. It connects different departments—like sales, customer service, marketing, and commerce—so everyone shares a single, up-to-date view of customer data.

Project Overview

HandsMen Threads is a premium fashion business that uses Salesforce to manage customer, product, order, inventory, and financial data efficiently. The project focuses on maintaining data accuracy through UI-based validation and automating key business processes such as **order confirmation emails, customer loyalty updates, low-stock alerts, and scheduled midnight order processing**.

The solution improves customer engagement, data consistency, inventory management, and overall operational efficiency.

Key Concepts & Technical Learnings

(i)Data Modeling & Custom Objects:

- Designed customized custom objects, fields, and relationships (Master-Detail / Lookup) to capture specific retail and operational data.
- Configured tabs and built custom apps using Lightning App Builder for an efficient user experience.

(ii) Data Quality & Security:

- Implemented validation rules to enforce data accuracy directly from the User Interface (UI).

- Configured Profiles, Roles, and Permission Sets to maintain data privacy and granular access control.

(iii) Process Automation :

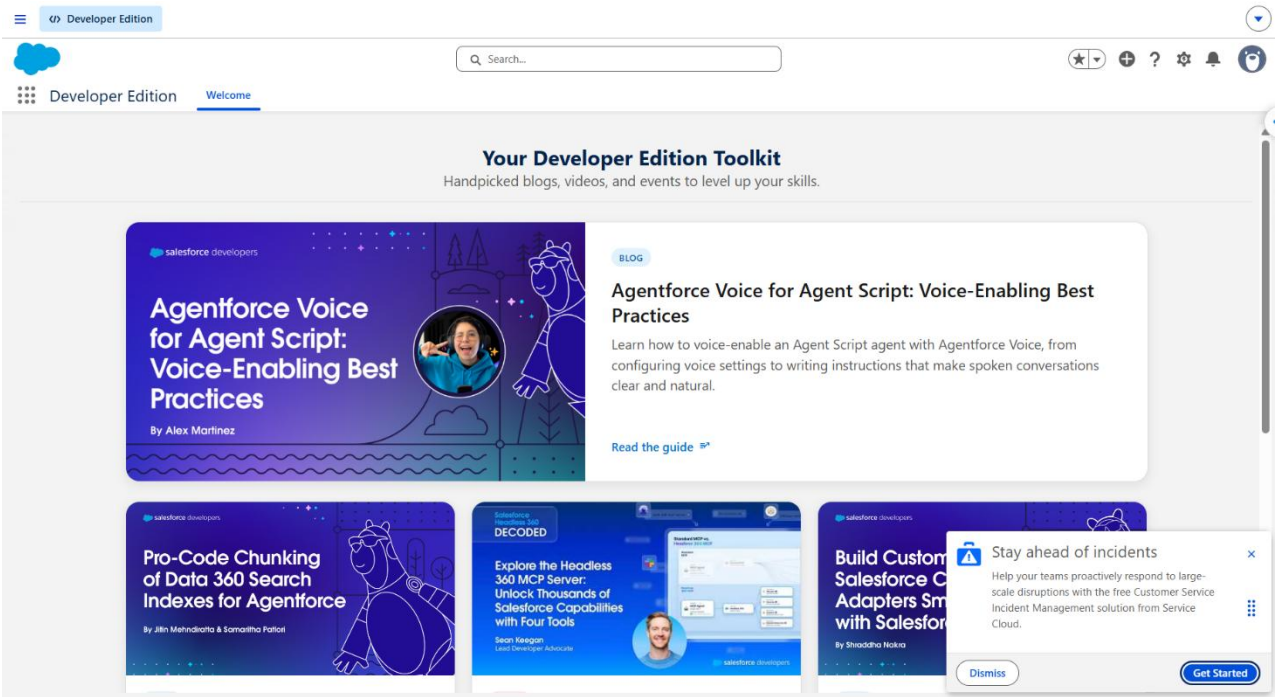

- Developed Record-Triggered Flows to send automated email confirmations upon order placement and trigger stock alert notifications when inventory levels drop below threshold limits.
- Created custom Email Templates for standardized business communications.

(iv) Apex & Asynchronous Processing:

- Developed Apex Triggers and logic to dynamically update customer loyalty statuses based on purchase history.
- Utilized Asynchronous Apex and Batch Jobs to execute scheduled midnight processing for bulk orders and inventory adjustments without impacting daily system performance.

Module 1:Creating Developer Account

Set up the Salesforce Developer environment for hands-on configuration.

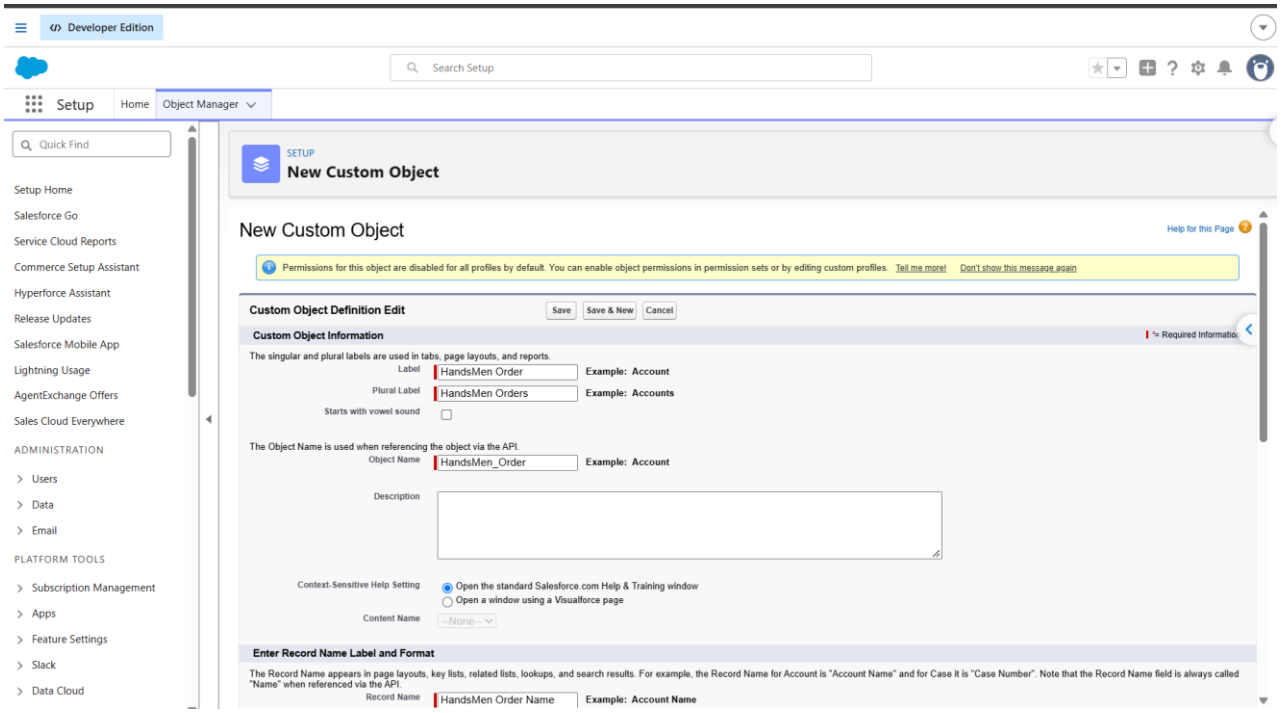

(i) Navigated to the Salesforce Developer Signup Page.

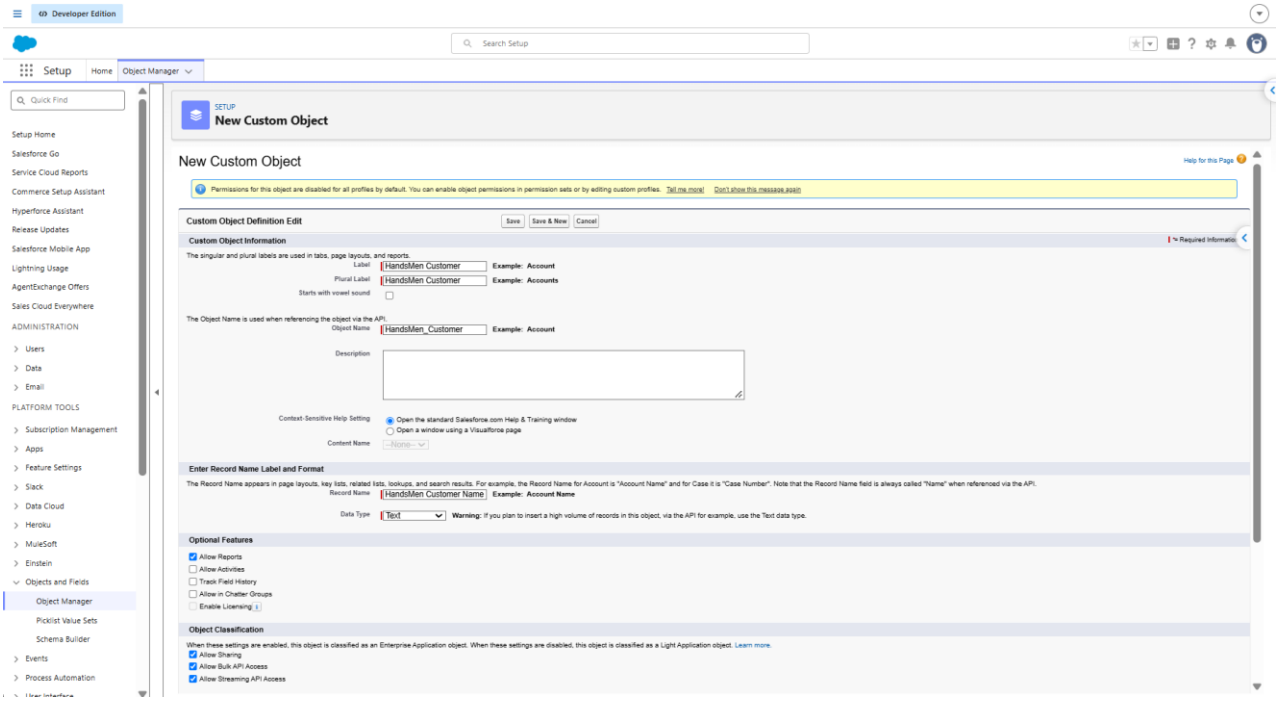

(ii)Registered using the developer role and organizational details.

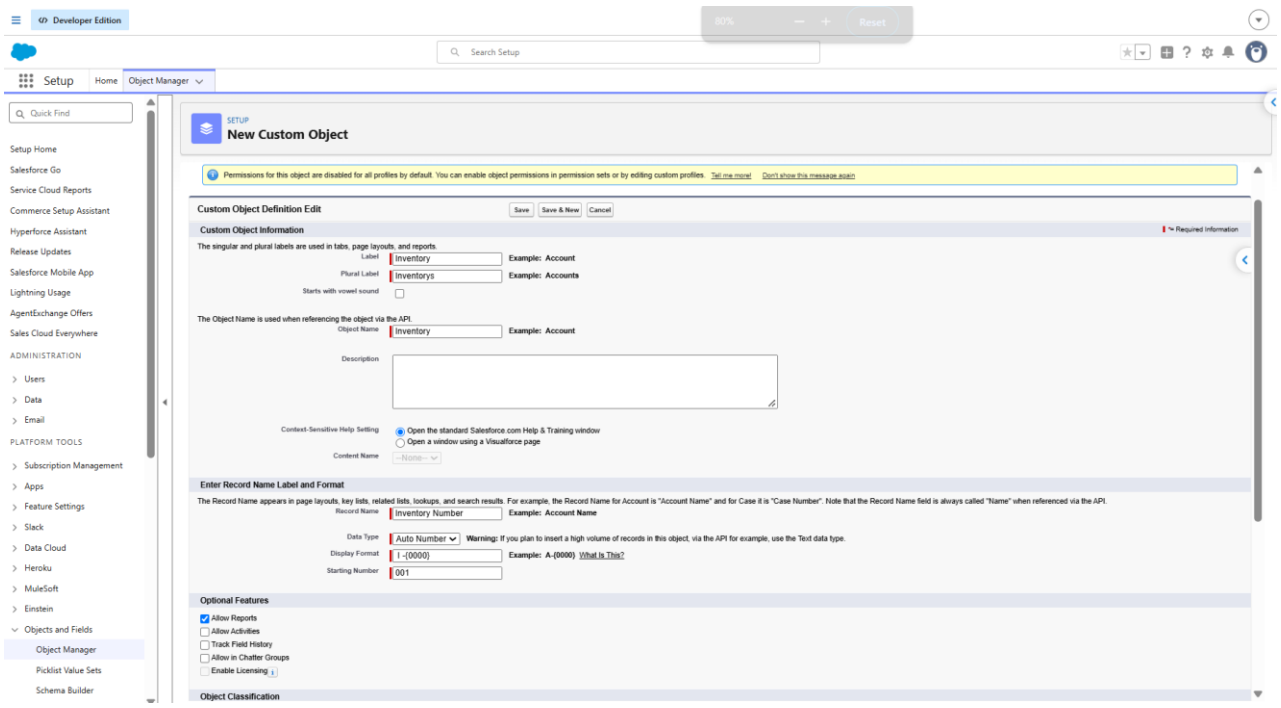

(iii)Verified the account via email and set up developer credentials.

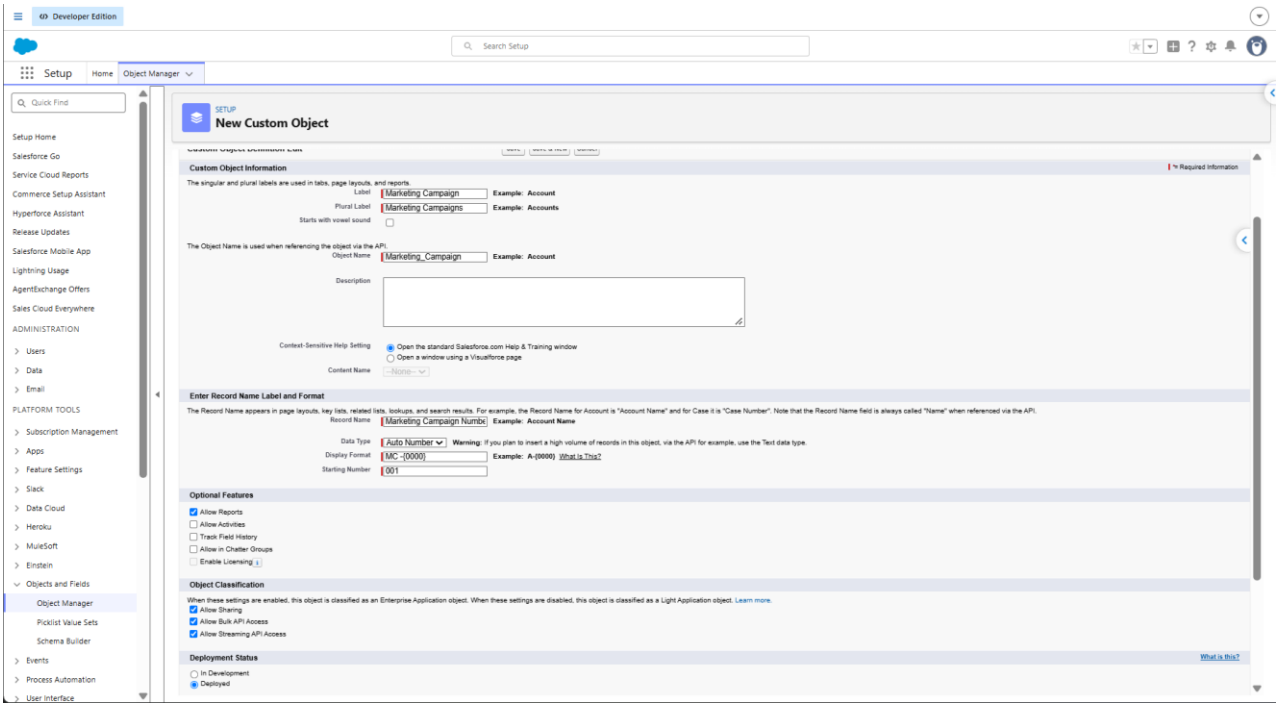

Module 2 :Data Management Objects

Created custom objects in Salesforce to store core business data for the HandsMen Threads application.

(i) Custom Objects Created:

- HandsMen Customer: Stores customer details, preferences, and contact information.
- HandsMen Product: Stores apparel catalog items, pricing, and descriptions.
- HandsMen Order: Tracks customer purchases, transaction details, and order statuses.

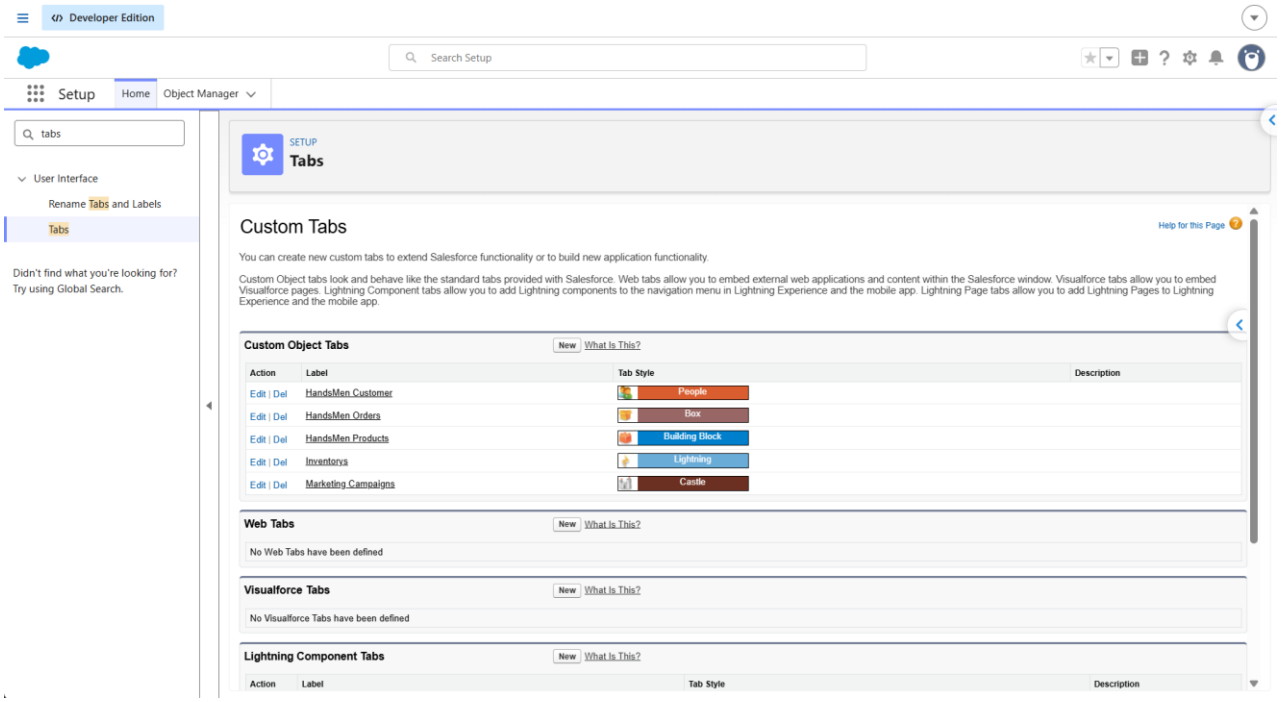

- Inventory: Tracks available product stock levels and warehouse locations.
- Marketing Campaign: Manages promotional activities and loyalty marketing efforts.

(ii) Implementation Steps:

1. Navigated to Setup → Object Manager → Create → Custom Object.
2. Defined Object Label, Plural Label, and Record Name format.
3. Enabled Allow Reports and Allow Search options, then saved each object

Module 3: Data Management - Tabs

Created custom object tabs to allow easy navigation and access to custom records within the Salesforce navigation bar**.**

(i) Custom Tabs Created:

- HandsMen Customer Tab: Custom tab mapped to the HandsMen Customer object.

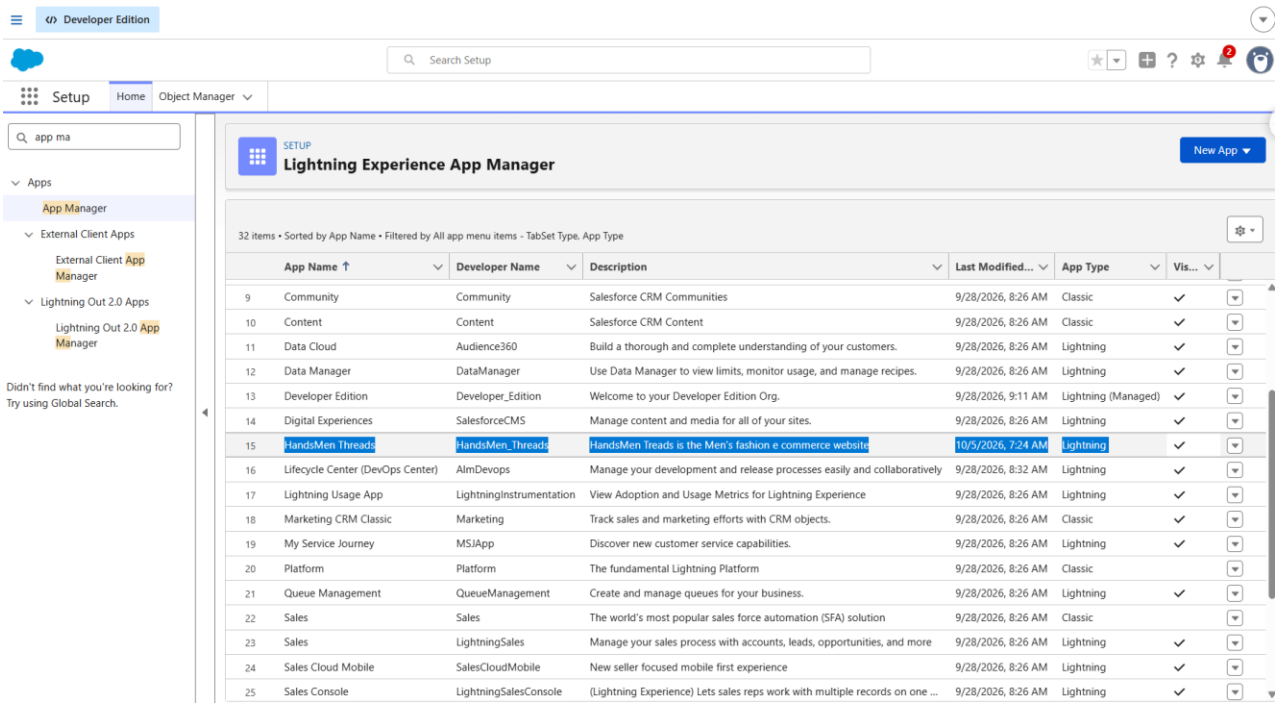

- HandsMen Product Tab: Custom tab mapped to the HandsMen Product object.
- HandsMen Order Tab: Custom tab mapped to the HandsMen Order object.
- Inventory Tab: Custom tab mapped to the Inventory object.
- Marketing Campaign Tab: Custom tab mapped to the Marketing Campaign object.

(ii) Implementation Steps:

1. Navigated to Setup → Tabs in the Quick Find bar.
2. Clicked New under Custom Object Tabs.
3. Selected the target object (e.g., HandsMen Customer) and chose a distinct Tab Style.
4. Kept default settings for profile visibility and custom app assignment, then saved.

Module 4: Data Management - App Manager

Created a custom Lightning App named HandsMen Threads to provide a unified workspace containing all relevant tabs, objects, and tools for business operations.

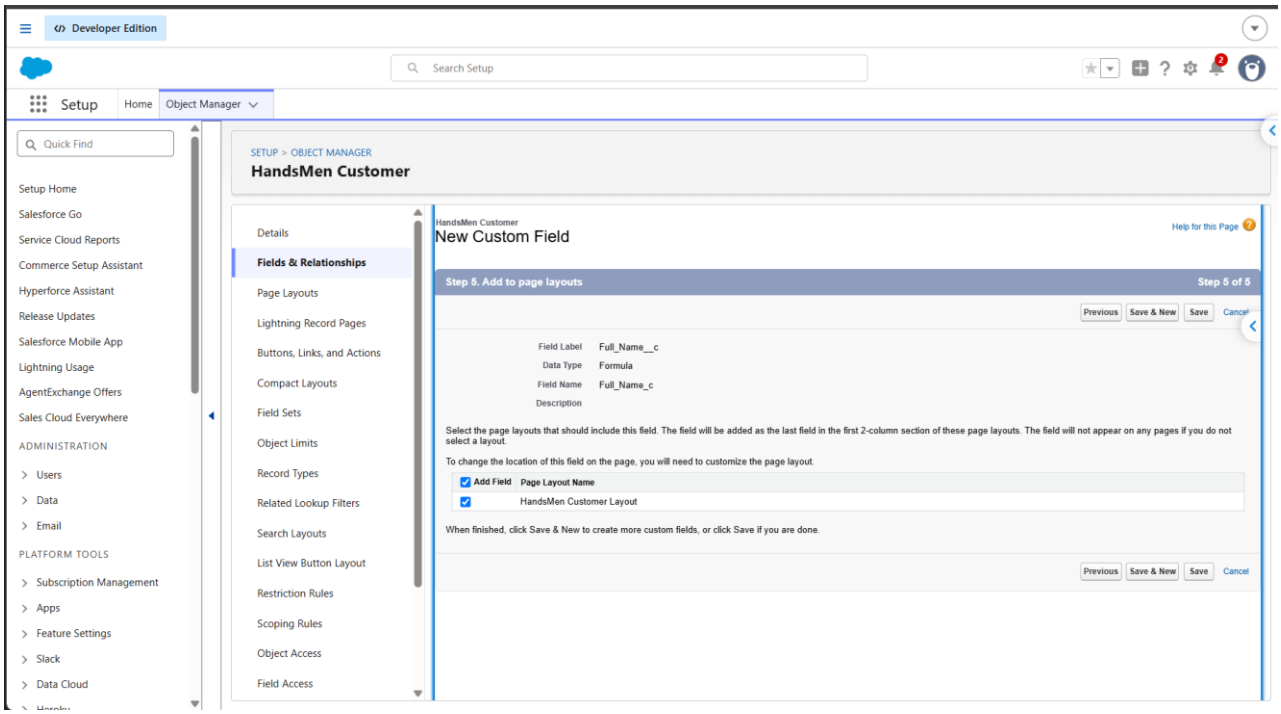

(i) Implementation Steps:

1. Navigated to Setup → App Manager in the Quick Find box and clicked New Lightning App.
2. Entered the App Details, Description, and App Name (HandsMen Threads), then kept default options for App Options and Utility Items.
3. Selected and moved the required navigation items into the Selected Items box.
4. Selected System Administrator under User Profiles, then clicked Save & Finish.

Module 5: Data Management – Fields

Created custom fields across objects to capture detailed information on customers, products, orders, inventory, and promotional campaigns.

(i) Custom Fields & Data Types:

- **HandsMen Customer Object:**
  - Customer Email (Email) – Stores customer contact email.
  - Phone Number (Phone) – Captures customer phone contact.
  - Loyalty Tier (Picklist: *Bronze, Silver, Gold, Platinum*) – Tracks customer membership status.
- **HandsMen Product Object:**
  - Price (Currency) – Defines product unit price.
  - Category (Picklist: *Shirts, Suits, Trousers, Accessories*) – Categorizes product types.
  - SKU Code (Text) – Unique identifier for inventory tracking.
- **HandsMen Order Object:**
  - Customer (Lookup to HandsMen Customer) – Links order to the customer.
  - Order Date (Date/Time) – Captures transaction timestamp.
  - Total Amount (Currency) – Stores total order value.
  - Status (Picklist: *Draft, Processing, Completed, Cancelled*) – Tracks fulfillment stage.
- **Inventory Object:**
  - Product (Lookup to HandsMen Product) – Relates stock level to a product.
  - Stock Quantity (Number) – Tracks available stock level.
  - Reorder Threshold (Number) – Set limit to trigger low-stock notifications.

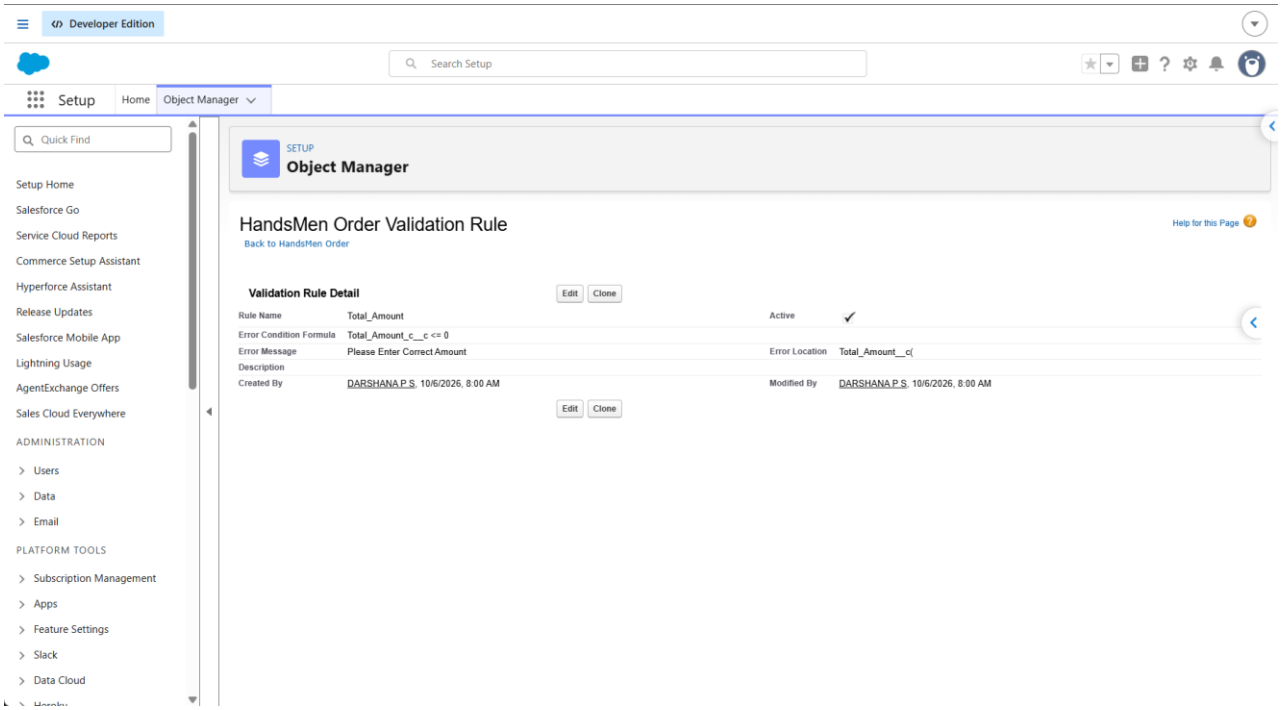

(ii) Implementation Steps:

1. Navigated to Setup →Object Manager and selected the target object.
2. Clicked Fields & Relationships →New.
3. Selected the appropriate Data Type (e.g., *Currency, Picklist, Lookup Relationship*).

4. Entered Field Label, Field Name, and necessary constraints, then configured profile-level security and page layout assignment before saving.

Module 6: Data Configuration - Validation Rules

Implemented custom validation rules across objects to enforce data accuracy, prevent invalid record creation, and maintain strict data integrity.

(i) Validation Rules Configured:

➢ **Total Amount Check (HandsMen Order__c)**

- Formula: Total_Amount__c <= 0
- Error Message: "Please Enter Correct Amount"
- Error Location: Field (Total Amount)
- Purpose: Ensures order amounts are greater than zero before saving.

➢ **Stock Quantity Check (Inventory__c)**

- Formula: Stock_Quantity__c <= 0
- Error Message: "Stock quantity must be greater than 0"

- Error Location: Field (Stock Quantity)
- Purpose: Restricts setting non-positive stock counts for inventory items.

➢ **Email Domain Check (HandsMen Customer__c)**

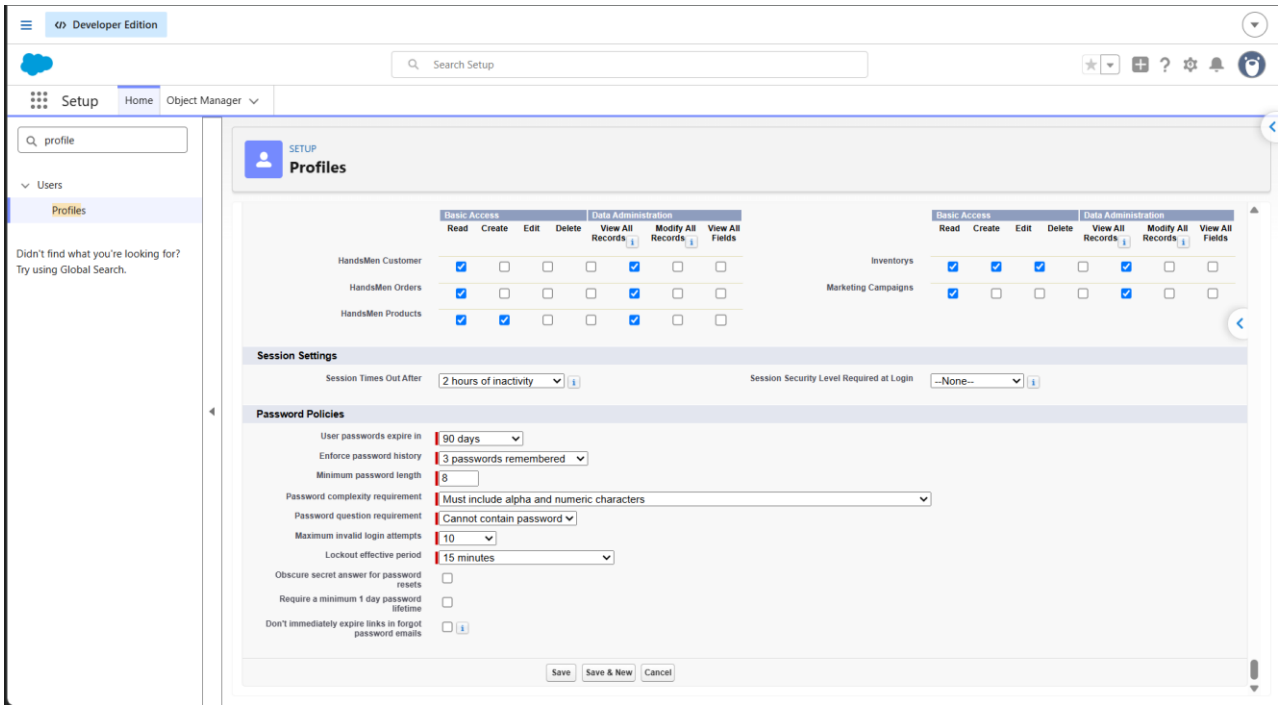

- Formula: NOT(CONTAINS(Email, "@gmail.com"))
- Error Message: "Please enter a valid Gmail address"
- Error Location: Field (Email)
- Purpose: Enforces valid email formatting and specific domain standards for customer records.

(ii) Implementation Steps:

1. Navigated to Setup → Object Manager and selected the target object.
2. Clicked Validation Rules → New.
3. Defined Rule Name, active status, and entered the corresponding Error
4. Set the Error Message and selected the Error Location before saving.

Module 7: Data Security – Profiles

Created custom user profiles to control object-level permissions and feature access for sales representatives and operational staff.

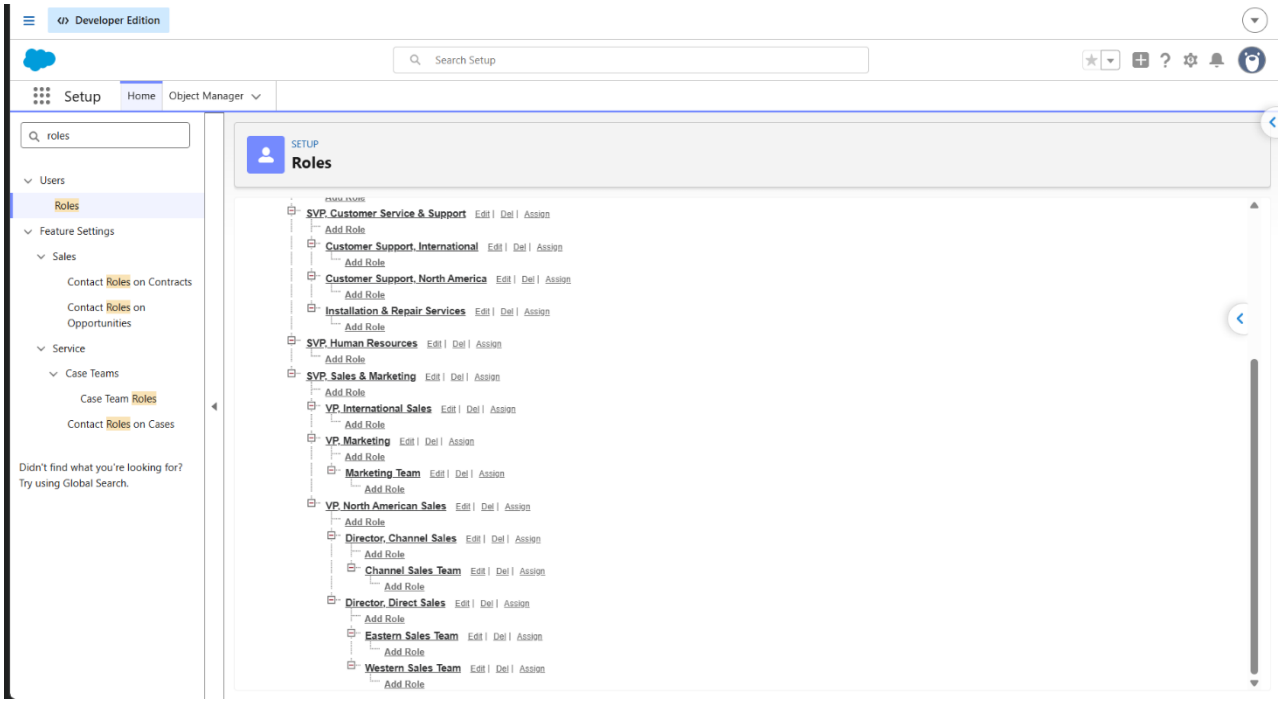

(i) Implementation Steps:

1. Navigated to Setup → typed Profiles in the Quick Find box → clicked Profiles.
2. Located Standard User, clicked Clone, entered the profile name (Platform 1), and clicked Save.
3. On the profile details page, clicked Edit.
4. Scrolled down to Custom Object Permissions and granted the required access permissions for HandsMen Products and Inventory objects.
5. Scrolled down and clicked Save.

Module 8: Data Security – Roles

Configured the role hierarchy in Salesforce to ensure appropriate record-level access and data reporting visibility across management levels.

(i) Role Details:

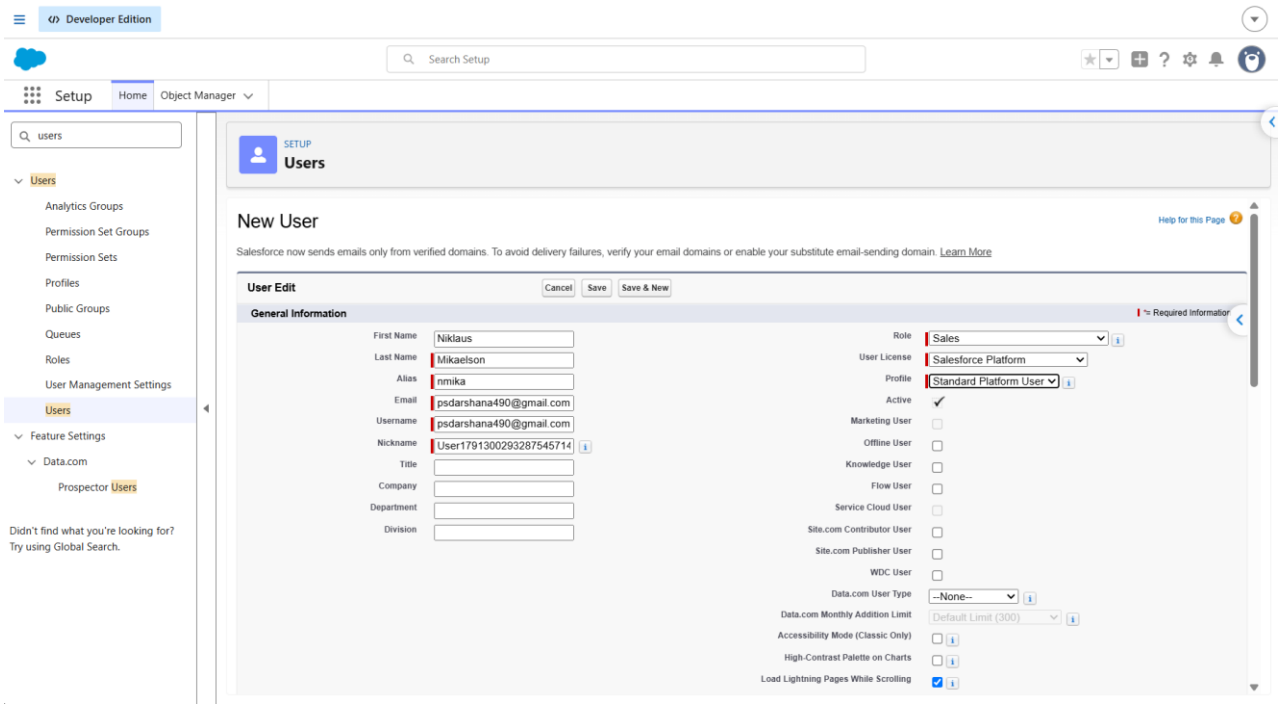

- Label: Sales
- Role Name: Sales *(auto-populated)*
- Reports To: CEO

(ii) Implementation Steps:

1. Navigated to Setup → searched for Roles in the Quick Find box → clicked Roles.
2. Clicked Set Up Roles and selected Expand All to view the existing role hierarchy.
3. Clicked Add Role directly under the CEO role.
4. Set the Label as Sales (Role Name auto-populated).
5. Confirmed that the role reports to the CEO and clicked Save.

Module 9: Data Security – Users

Created user accounts in Salesforce and assigned specific roles, licenses, and custom profiles to grant appropriate operational access.

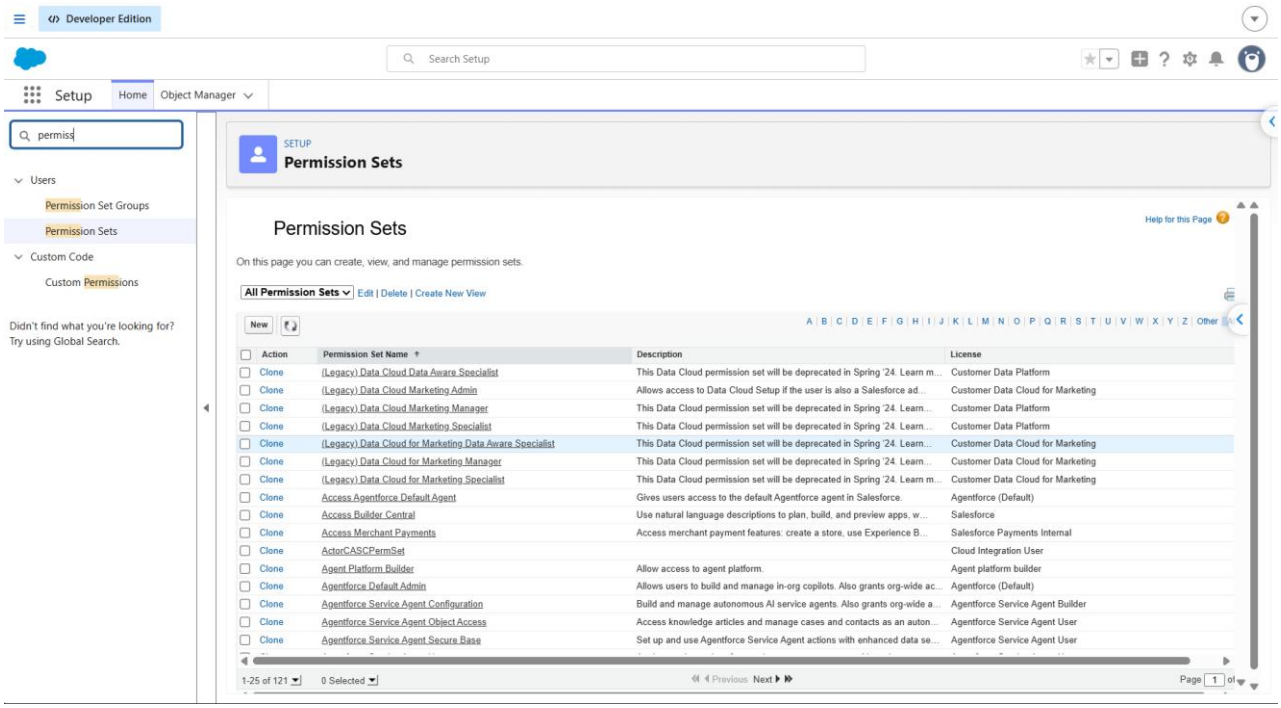

(i) Implementation Steps:

1. Navigated to Setup → searched for Users in the Quick Find box → clicked Users.
2. Clicked New User.
3. Entered the required user details:
4. First Name & Last Name (e.g., Niklaus Mikaelson)
5. Alias & Nickname
6. Email: Active personal email address
7. Username: Set in standard email format (text@text.text).

Module 10: Data Security - Permission Set

Created and assigned custom permission sets to extend object-level access permissions (Read, Create, Edit, Delete) for specific users without altering their base profile settings.

(i) Permission Set Details:

- **Permission Set Label:** Permission_Platform_1
- **API Name:** Permission_Platform_1 *(auto-populated)*
- **Target Objects Updated:** HandsMen Customer, HandsMen Order
- **Object Permissions Granted:** Read, Create, Edit, Delete (CRUD)
- **Assigned Users:** Selected user(s) with the Platform 1 profile

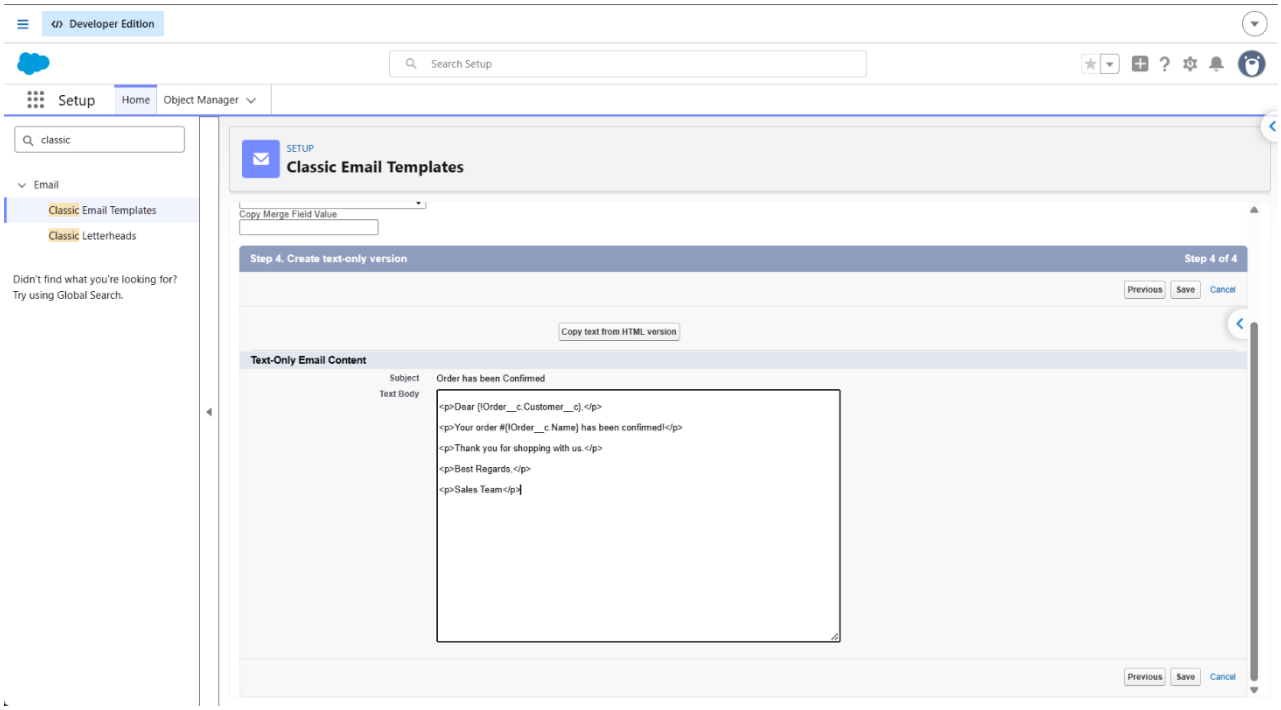

(ii) Implementation Steps:

1. Navigated to Setup → typed Permission Sets in Quick Find → selected Permission Sets.
2. Clicked New, entered Label as Permission_Platform_1, and clicked Save.
3. Under Apps, selected Object Settings.

4. Clicked HandsMen Customer, clicked Edit, enabled Read, Create, Edit, Delete permissions, and clicked Save.
5. Repeated the steps for the HandsMen Order object to enable Read, Create, Edit, Delete permissions.
6. Clicked Manage Assignments → Add Assignment.
7. Selected the target user(s) assigned to the Platform 1 profile, clicked Next, then clicked Assign and Done.

Module 11: Email Template & Email Alert

Created customized Classic Email Templates and configured Email Alerts to automate customer order confirmations and operational communications.

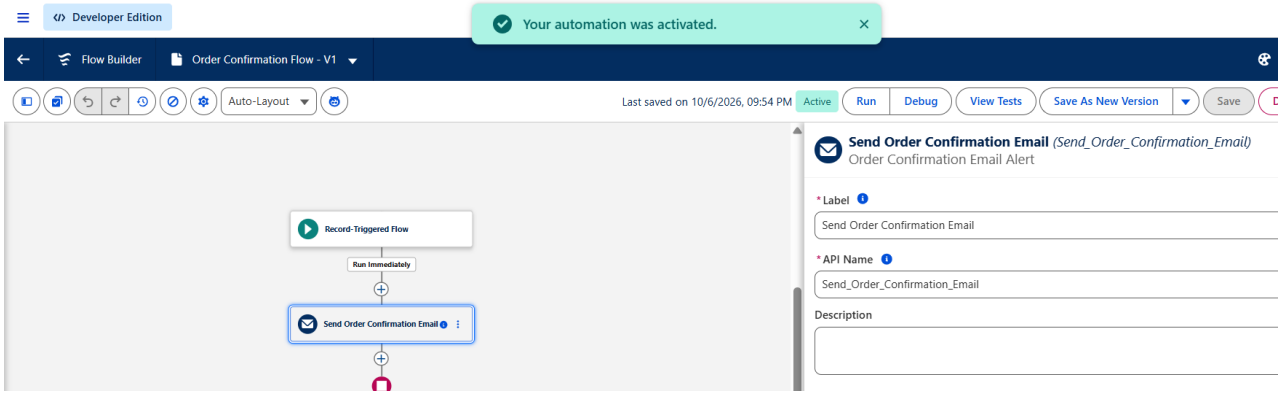

(i) Implementation Steps:

1. Navigated to Setup → searched for Classic Email Templates in Quick Find.
2. Clicked New Template, selected HTML (with Classic Letterhead) (or Custom), and clicked Next.
3. Set Folder to Unfiled Public Email Templates, checked Available For Use, and set the Template Name to Order_Confirmation_Email.

4. Entered the Subject line and HTML Body with merge fields (e.g., {!Order__c.Customer__c}).
5. Saved the template, then navigated to Email Alerts in Setup to map the template to automated workflow/flow triggers.

Module 12: Process Automation – Flows

Configured Salesforce Record-Triggered and Scheduled Flows to automate business processes, such as sending confirmation emails upon order updates and low-stock inventory alerts.

(i) Flow Configurations:

i. Order Confirmation Email (Record-Triggered Flow)
ii. Stock Alert Email (Record-Triggered Flow)
iii. Scheduled Inventory Sync (Schedule-Triggered Flow)

(ii) Implementation Steps:

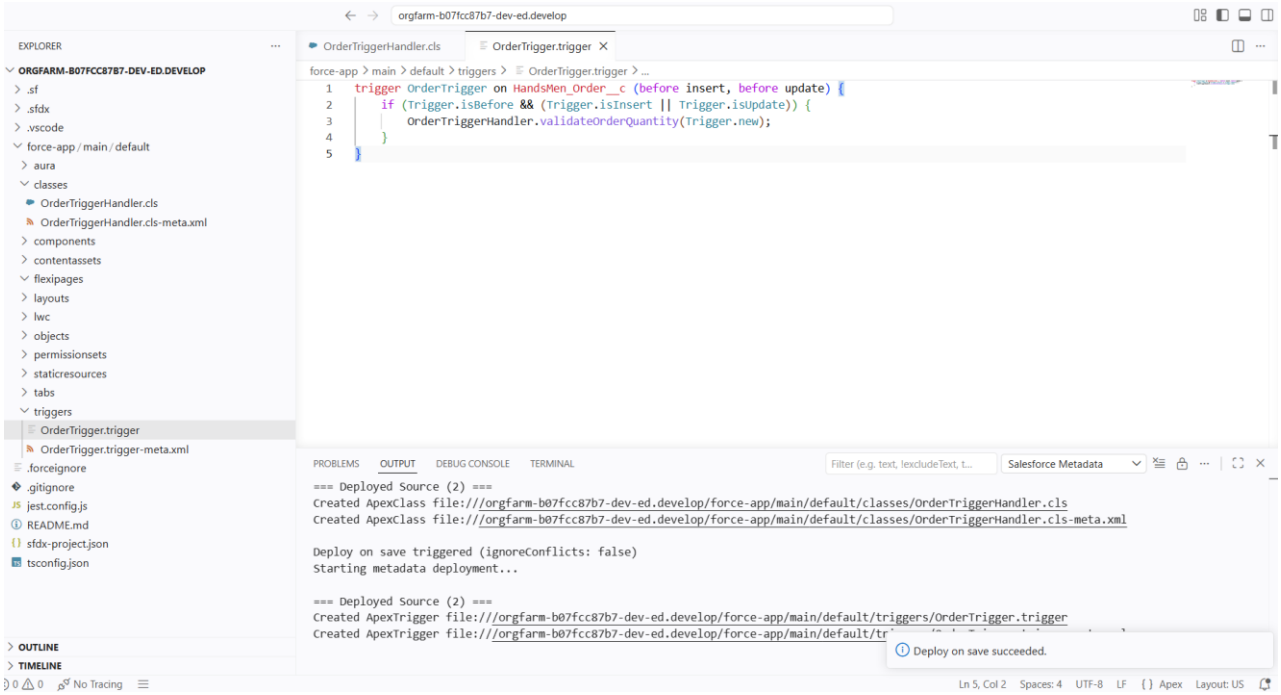

1. Navigated to Setup → searched for Flows in Quick Find → clicked Flows.
2. Clicked New Flow, selected Record-Triggered Flow (or Schedule-Triggered Flow), and clicked Create.
3. Selected the target Object (e.g., Order__c), defined trigger conditions and filter criteria.
4. Added an Action element (+ icon → Action → Send Email Alert), linked the corresponding email alert, and passed {!$Record.Id}.

5. Saved the flow, entered the Flow Label, and clicked Activate.

Module 13: Automation using Apex

Developed Apex Classes and Triggers on the HandsMen_Order__c object to validate order quantities based on order status before records are created or updated.

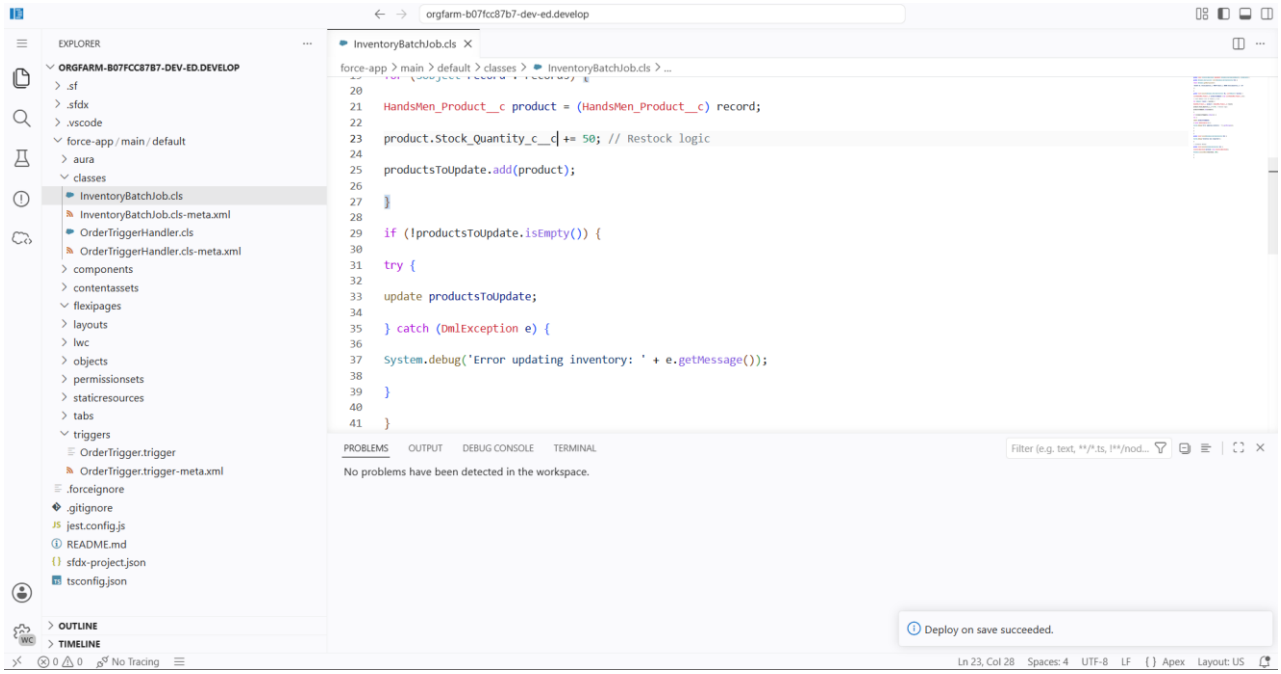

(i) Implementation Steps:

1. Opened Developer Console via Setup → Gear Icon → Developer Console.
2. Created Apex Class: File → New → Apex Class, named it OrderTriggerHandler, pasted the handler code, and saved.
3. Created Apex Trigger: File → New → Apex Trigger, named it OrderTrigger, selected HandsMen_Order__c as the sObject, pasted the trigger code, and saved.

Module 14: Batch Jobs

Implemented a batch Apex class implementing Database.Batchable and Schedulable to periodically check product inventory levels, automatically restock items falling below threshold limits, and schedule daily execution.

(i) Implementation Steps:

1. Navigated to Setup →Gear Icon →Developer Console.
2. Clicked File →New →Apex Class, named it InventoryBatchJob, pasted the batch job code, and saved.

3. Clicked Debug →Open Execute Anonymous Window, pasted the scheduling snippet, and clicked Execute.
4. Verified execution status in Setup →Scheduled Jobs via Quick Find.

Project Outcome:

The HandsMen Threads Salesforce application was successfully configured and verified. Through custom data modeling, security controls, validation rules, process automation, Apex triggers, and scheduled batch jobs, the platform fully automates inventory restocking, order quantity validations, and real-time email alerts, delivering a complete CRM solution for business operations.
